Feasibility of an AI-Assisted Faceless Educational Video Workflow

Academic Research Proposal - Chapters I to V

Edition B | 16 October 2026 | PUBLIC | Proposed study, not completed thesis

Formal Title Page

Feasibility of an AI-Assisted Faceless Educational Video Production Workflow: A Proposed Mixed-Methods Pilot Study

An independent preliminary research proposal
Candidate research setting: Philippines
October 2026

No institution, thesis adviser, respondents, ethics approval or degree award is claimed.

Abstract

This proposal develops a method to evaluate whether an independent content creator can use AI-assisted scripting, voice and visual tools to produce original, factual, rights-cleared educational videos at manageable cost. The idea was recovered from October 2026 discussions seeking an evidence-based faceless media venture, including niche selection, tool evaluations, expenditure tracking, production failures and audience measurements. A previous conversation summary describes a drafted video, but no primary performance data were independently audited. The proposed developmental mixed-methods pilot measures creation minutes, cash cost, factual and media-rights compliance, repeatability, upload acceptance and normalized engagement indicators across two niches. Prospective data collection and review must precede empirical conclusions. The contribution is a replicable research protocol and documentation format, not evidence that the approach is already profitable.

Keywords: generative artificial intelligence, faceless media, educational video, content creation, feasibility, research proposal, Philippines.

Table of Contents

1. Chapter I - The Problem and Its Background
2. Chapter II - Review of Related Literature and Studies
3. Chapter III - Research Methodology
4. Chapter IV - Proposed Results and Discussion
5. Chapter V - Summary, Conclusions and Recommendations
6. References and Appendices

List of Figures: Figure 1 - Conceptual editorial pipeline; Figure 2 - Input-process-output research framework.

List of Tables: Table 1 - Variable definitions; Table 2 - Illustrative cost sensitivity; Table 3 - Review and rights audit form.

Abbreviations: AI, artificial intelligence; CTR, click-through rate; NIST, National Institute of Standards and Technology; OECD, Organisation for Economic Co-operation and Development; YPP, YouTube Partner Program.

CHAPTER I - THE PROBLEM AND ITS BACKGROUND

Introduction

Independent creators can use generative tools for ideas, scripts, audiovisual content and editing

assistance. These efficiencies are uncertain because output must still be made accurate, original, accessible and lawful. OECD (2024) discusses creative-sector opportunities and intellectual-property tensions; it does not establish profitability for individual channels. This study therefore treats the human review and documentation burden as part of production cost.

Background of the Study

The recovered owner proposal was a faceless multi-platform media experiment with public discussion of niche selection, costs, tool failures and monetization outcomes. A prior assistant proposed a production pipeline; that design is a later recommendation, not independently recovered evidence that it operates. A reported video draft in October 2026 does not establish posting, channel eligibility, viewership or research findings.

Statement of the Problem

There is inadequate local project evidence to determine the effectiveness, quality or commercial feasibility of a hybrid human-AI faceless media workflow. The proposed study will investigate repeatability, editorial risk and costs while describing the uncertainty caused by small samples and platform policies.

Objectives

General: design and evaluate a controlled AI-assisted faceless educational video production workflow.

Specific: (1) document the complete editorial process; (2) measure direct expenditure and labor per accepted video; (3) assess verifiable claims and content-rights traceability; (4) document upload success and required synthetic-media disclosures; (5) compare two candidate niches over equivalent observation windows; and (6) propose evidence-based expansion or termination rules.

Research Questions

RQ1. What production time and cash outlay are observed for each accepted video? RQ2. What portion of verifiable claims has retained credible support? RQ3. What portion of used audiovisual assets has documented commercial or educational rights? RQ4. How consistent is upload success and content quality across repeated exports? RQ5. What differences in available platform retention metrics are observed between candidate niches?

Hypotheses

H1 (unverified): AI assistance combined with editorial quality checks may reduce labor time relative to comparable manual production. H2 (unverified): documented editorial review may reduce preventable post-publication corrections. The proposed micro-sample cannot establish robust population-wide causality; quantitative results are primarily descriptive.

Significance

Creators can obtain a reproducible accounting model; learners may benefit from better explained technical topics; educators can assess the integrity and accessibility of AI-assisted teaching materials; later researchers can replicate or extend the pilot.

Scope and Delimitations

Candidate setting is one independent creator producing original English or bilingual educational explainers, with YouTube as the principal measurement environment and optional secondary platforms. The pilot proposes three videos for each of two predefined niches, selected before data collection. No sample survey or respondents currently exists. Platform distribution algorithms, topic complexity, personal skill, third-party rights and changing partner rules constrain generalization.

Operational Definitions

Accepted video: output passing documented factual, rights, technical and disclosure gates. Source coverage: supported verifiable claims divided by all verifiable claims. Direct cost/video: attributable paid expenses divided by accepted outputs. Average viewing percentage: platform-reported measure, used only with a named platform and fixed observation date.

CHAPTER II - REVIEW OF RELATED LITERATURE AND STUDIES

Foreign Literature

OECD (2024) examines generative-AI adoption and labor exposure, including creative work. Its relevance is motivation for examining efficiency and skill impacts, not a quantified return on this particular venture. Autio et al. (2024) describe NIST's generative-AI risk-management profile (govern, map, measure and manage); those practices motivate a review ledger, factual checks and documented human responsibility.

Relevant Technology and Industry Sources

YouTube Help (n.d.) requires disclosure for sufficiently realistic synthetic or altered content, including certain depictions of real people, places or events. YouTube (2026) announced altered thresholds for new YPP ad/Premium applicants effective 1 February 2027, identifying 8,000 qualified watch hours or 20 million Shorts views, depending on route and other conditions. The business-study budget should not presume that existing or future eligibility yields revenue. Digital-media tools can reduce editing steps without removing editorial liability.

Local Literature

The Philippine National Privacy Commission (2012) publishes Republic Act No. 10173, the Data Privacy Act of 2012. Any collection of identifiable reviewers' comments, respondent survey records or personal images must be assessed under applicable law. No relevant Filipino peer-reviewed channel feasibility study was confirmed for this edition; no local experimental conclusion is attributed to nonexistent literature.

Existing Solutions and Studies

Relevant approaches are manual content editing, outsourced video production, rigid template-based generation and human-AI hybrid workflows. Commercial products are implementation alternatives rather than scholarly evidence of improved learning or revenue. A controlled pilot is needed to quantify effects under a specific operator's constraints.

Comparative Literature Matrix

Reference | What it supports | What it does not prove
OECD (2024) | AI use and labor/copyright context | Solo-channel profitability
Autio et al. (2024) | Risk controls for generative AI | Measured video quality improvement
YouTube (2026) | Upcoming eligibility conditions | Partner acceptance
YouTube Help (n.d.) | Disclosure rules | Copyright clearance
NPC (2012) | Philippine privacy law | Actual operational compliance

Synthesis and Research Gap

External publications document risks and policy constraints but cannot replace the project's missing production logs, editorial quality audit, audience analytics and operational costs. The proposed contribution is a repeatable measurement protocol that does not confuse AI tool output with research findings.

Theoretical and Conceptual Framework

Figure 1 (conceptual): topic and source register -> human-reviewed script -> legally cleared narration and visual assets -> edit -> factual/rights/accessibility audit -> platform publishing -> analytics -> corrected process.

Figure 2 (input-process-output): inputs (time, tools, sources, cost) -> hybrid workflow with review gates -> outputs (accepted videos, expense ledger, quality results and analytics). Confounding factors include niche, platform algorithm, distribution context and audience.

CHAPTER III - RESEARCH METHODOLOGY

Research Design

Use prospective developmental research with descriptive quantitative logs and structured qualitative observations. Optional reviewer evaluation may be included with consent. This proposal is not a randomized trial or completed system validation.

Research Environment and Sampling

One independent editing workstation and published platform dashboards form the proposed setting. Choose two niches in advance based on transparent selection rules and develop three original videos in each niche; match approximate duration and content difficulty. External reviewers are not presumed recruited. A manual baseline, when technically comparable, may be tested separately and fully documented.

Research Instruments

Table 1 - Planned measures

Measure	Instrument	Computation or rule
Production time	Timestamped creator log	Minutes/accepted video
Direct cash cost	Expense and credit register	PHP/accepted video
Fact traceability	Claim-source checklist	Supported/total verifiable claims
Rights traceability	License/permission register	Cleared/total used assets
Corrections	Versioned incident log	Confirmed issues per video
Upload success	Platform export register	Accepted/attempted uploads
Viewer retention	Dated platform analytics	Platform-native metric and window

Data Collection Procedure

Record the approved protocol and content themes before editing. Capture manual and assisted task durations, per-asset rights decisions and claim sources. Obtain an independent content review when possible. Publish only after the documented quality gate. Save dashboard exports at consistent periods, such as 7 and 28 days. Retain zero-view and rejected exports to avoid survivor bias. Store only aggregated non-identifying audience analytics.

Development and Evaluation

The process follows requirements -> scripted prototype -> iterative editorial review -> quality audit -> publish -> logged observation -> improvements. Apply the same checklist to each niche. Track missing data explicitly. Measure repeatability from saved masters rather than merely counting drafts.

Statistical Treatment

Report counts, medians, ranges and interquartile ranges for small samples. Use numerator and denominator for every fraction. Cross-niche comparisons remain exploratory. Do not use invented p-values, causal claims or general population conclusions from six purposively selected videos. Additional sampling and a preregistered inferential plan would be needed for formal hypothesis testing.

Ethics and Information Security

Require voluntary informed consent for human evaluators and institutional review when applicable. Avoid unnecessary personal-data collection. Protect rights-cleared media records, honor commercial licenses and disclose relevant realistic AI-generated visuals. Do not claim ethics approval without documentation.

CHAPTER IV - PROPOSED RESULTS, ANALYSIS AND DISCUSSION

Current Evidence Status

No independently verified original market survey, participant observations, audience analytics or trial revenue is available for this study. An October 2026 historical context indicates a draft video, but this report cannot convert that into a peer-reviewed or operational result.

Expected Output Forms (Not Actual Findings)

Table 2 - Cost sensitivity, entirely illustrative assumptions: C = PHP 1,200 monthly cash costs; H = 20 labor hours; R = PHP 100/hour imputed labor. Formula: labor-inclusive cost/video = (C + H x R)/V. For V = 4, cost/video = PHP 800; V = 8, PHP 400; V = 12, approximately PHP 267. Every input requires observed replacements. No profitability inference follows.

Table 3 - Evaluation form: video ID; format; niche; factual claims; verified claims; assets; cleared assets; disclosures; total minutes; cash expenditure; rejected exports; corrected errors; platform observation windows; recorded viewer metrics.

Proposed Analysis

Test whether each candidate niche generates enough original material, acceptable video quality and tolerable editing demands. Use preregistered minimum editorial standards and financial spending cap. Report negative outcomes, tool failures and missing observations. The expected value is reliable information for a stop-or-expand decision, not an expected finding that AI is superior.

CHAPTER V - SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Summary

The proposal structures a small creator-business experiment into an academic method with accountable original media, source and rights management, cost recording and consistent evaluation.

Evidence-Bounded Conclusions

Existing public sources establish relevant AI risk and platform policy context. No recovered measured data establish audience growth, improved learning, operational savings or positive return for this specific project. The work is a preliminary academic research proposal, not a completed thesis.

Recommendations

Run the pilot with preregistered quality thresholds, direct expense logging, full media-rights checks and preserved correction history. Verify application-time platform rules. Publish completed empirical results only after actual collection, review and ethical clearance when needed.

Future Directions

Larger samples, multilingual content, cross-creator comparisons, accessibility and audience learning outcomes may justify further research after a valid pilot.

Appendices

Appendix A - Optional interview questions (not administered)

What helps you trust an educational video? How do you decide whether to finish watching? What accessibility improvements matter? What type of citations are most useful? Are you willing to permit de-identified research use of your comments? Consent review required before deployment.

Appendix B - Rights and Quality Review Checklist

Check claim citation, asset owner, license scope, commercial permission, visual realism, synthetic-media disclosure, consent, legibility, audio, captions, corrections mechanism and publication readiness. Each field needs a reviewer identifier and auditable evidence.

Appendix C - Data Dictionary

Store project ID, version, topic, production method, task timestamps, anonymized review result, license reference, claim evidence, accepted output identifier, expense, publication date, analytics observation date and missing-value reasons. Do not store login credentials or unnecessary identifying viewer records.

Appendix D - Source and Attribution Note

The owner’s media-business concept is supported by accessible historical context. Suggestions about the workflow and metrics are research design contributions, not quotes of the original discussion. No fabricated respondents, trial outcomes, subscriptions, platform earnings or thesis approvals are included.
